ABSTRACT. Distributional data for 10 species of Peltidae, Lophocateridae, Trogossitidae and Thymalidae recorded from Poland are summarised, and numerous unpublished records are reported. Data on feeding and habitat preferences are analysed. *Calitys scabra* and *Temnoscheila caerulea* are probably extinct in Poland. *Grynocharis oblonga*, *Nemozoma elongatum* and *Tenebroides mauritanicus* are relatively common in Poland. *Nemozoma caucasicum* is currently spreading within Europe and several new records in Poland are reported. *Peltis ferruginea*, *P. grossa*, and *Thymalus limbatus* are restricted to natural forests in Poland, where they are sometimes abundant. We suggest adding *Peltis ferruginea* and *Thymalus limbatus* to the Polish Red List of Animals. The opinion that *Grynocharis oblonga* and *Tenebroides mauritanicus* are relicts of natural forests does not seem justified.

KEY WORDS: Bark-gnawing beetles, saproxylic species, faunistics, new records, distribution maps.

INTRODUCTION

Trogossitidae and related families of beetles belong to the most unstable and problematic family-level taxa within the superfamily Cleroidea. A recent study based on molecular data (GIMMEL et al. 2019) showed that Trogossitidae (sensu: BOUCHARD et al. 2011) should be divided into several families, including Trogossitidae, Lophocateridae, Peltidae and Thymalidae. Most of the species recorded in Poland are easily identifiable, but despite this, our knowledge of their distribution, biology and habitat preferences is still limited. Historical data on the species recorded in Poland are summarised in BOROWIEC (1983) and BURAKOWSKI et al. (1986). A key to the identification of species known from central Europe was published by KOLIBÁČ (1993) and again by KOLIBÁČ et al. (2005).

The present paper deals with 10 species and 8 genera that have hitherto been recorded in Poland. Only some species are commonly recorded. Several of the rare species occur in natural forests, where they are associated with large-sized deadwood and wood-inhabiting fungi. Two species – *Calitys scabra* (THUNBERG, 1784) and *Temnoscheila caerulea* (OLIVIER, 1790) – have not been observed in Poland for over 100 years. *Lophocateres pusillus* (KLUG, 1833) is known from a single, accidental introduction to Poland.

In this paper, we have gathered unpublished data on ca. 3500 specimens collected in over 200 UTM squares (10 x 10 km) from institutional and private collections (Fig. 1). We have summarised data on the occurrence and habitat preferences in Poland of each species.

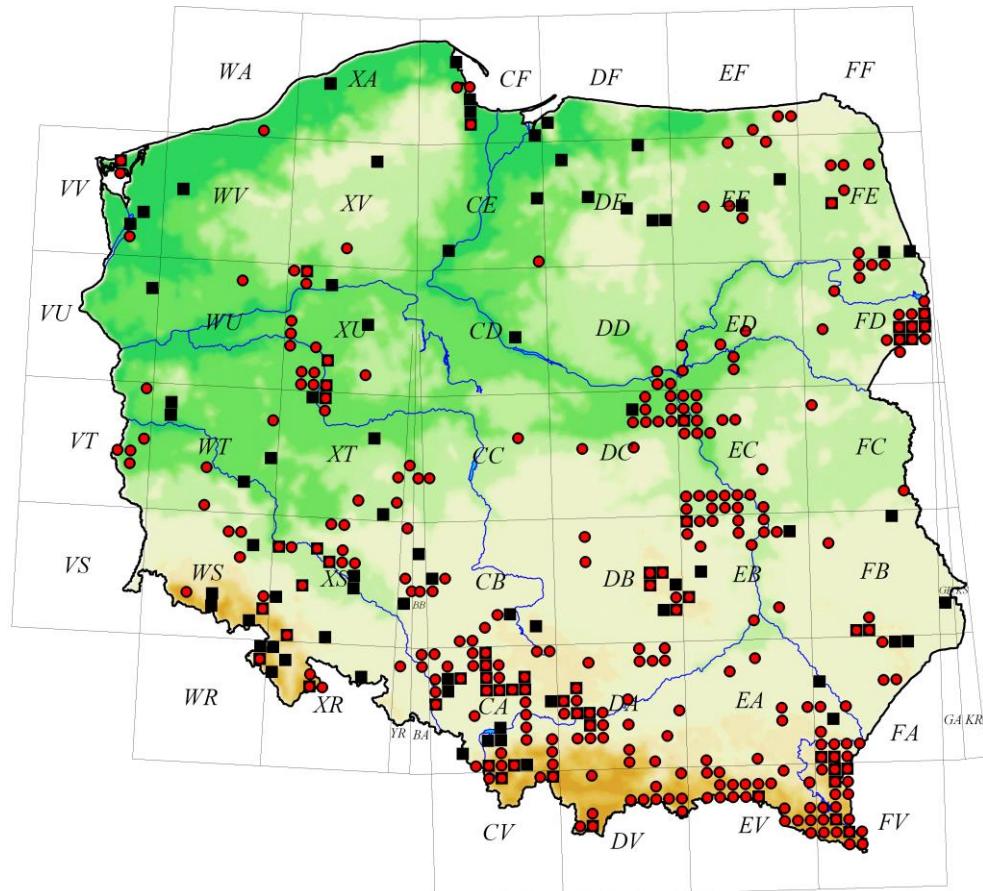

Fig. 1. Published records of Trogossitidae, Lophocateridae, Peltidae, and Thymalidae in Poland (black squares) and findings reported in the present paper (red circles).

MATERIALS AND METHODS

In the review of species, the division of Poland into regions is adopted after BURAKOWSKI et al. (1973). Records within a region are ordered alphabetically, and a 10 x 10 km UTM square is given for each record. Distribution maps were created with Gnomon 3.2 software. When only an approximate locality is known, e.g. the localities denoted as "Przemyśl vic." in the collection of T. TRELLA, the UTM square is marked with an asterisk (*).

Published records presented on the maps (Fig. 1–2, 4, 7–11, 13) are based on the following papers: RENDSCHMIDT (1841), KELCH (1846), ZEBE (1852), ROGER (1856), ROTTENBERG (1864, 1868), JABŁOŃSKI (1869), REITTER (1870), WACHTL (1870), LETZNER (1871), VIERTL (1872), KOTULA (1873), NOWICKI (1873), LENTZ (1879), FEIN & HAASE (1881), STOBIECKI (1883), ŁOMNICKI (1886), LETZNER (1888), SCHUMANN (1904), ALBIEN (1905), LGOCKI (1908), GERHARDT (1910), RIEHN (1912), TENENBAUM (1913), WANKA (1915), DORN (1919), SZULCZEWSKI (1922), NOWOTNY & POLENTZ (1933), RUSZKOWSKI (1933), SCHMIDT (1935), KUNTZE (1936), SCHMIDT (1938), STEFEK (1939), KLEINE (1940), POLENTZ (1942), SKURATOWICZ & URBAŃSKI (1953), JANICKI et al. The original spelling of localities is given in square brackets.

Abbreviations used in the text: ad – near, coll. – collection; comp. – forest compartment (“oddział leśny”); cult. – reared; ex. (exx.) – specimen (specimens); det. – identified (by); for. distr. – forest district (“nadleśnictwo”); for. div. – forest division (“leśnictwo”); Is. – island; leg. – collected (by); LP – Landscape Park; Mt. (Mts.) – mountain (mountains); NP – National Park; obs. – observation; res. – nature reserve; SAC – Natura 2000, Special Area of Conservation; vic. – vicinity.

SPECIES OVERVIEW

Family: Trogossitidae

Calitys scabra (THUNBERG, 1784)

Material examined. Eastern Sudeten Mts.: Kłodzko (Glatz) (XR18), collecting date unknown – 1 ex., leg. KLE [SDEI]. **Western Beskid Mts.:** Roztoka Wielka (DV78), Radziejowa Mt., 16 VII 1898 – 1 ex., leg. SAS (published as “vicinity of Rytro” in ROSSA

2004). **Tatra Mts.:** Kuźnice (DV25), 2 VII, year unknown (end of 19th century) – 2 exx., leg. MR [ISEA]; “Tatry”, without precise locality, mid-19th century – 2 exx., leg. EW [ISEA].

Distribution. A widely distributed species, extending from western Europe and north Africa to the Russian Far East and North America. A boreal-montane species in Europe, nowadays extinct in many localities. In Poland known from 19th century findings but never found since (Fig. 2, 3). The species has not been recorded from the Tatra Mts. before. Regarding its occurrence in the Czech eastern Sudeten Mts. (MERTLIK 2011), further searches are necessary, as a rediscovery of the species is still possible.

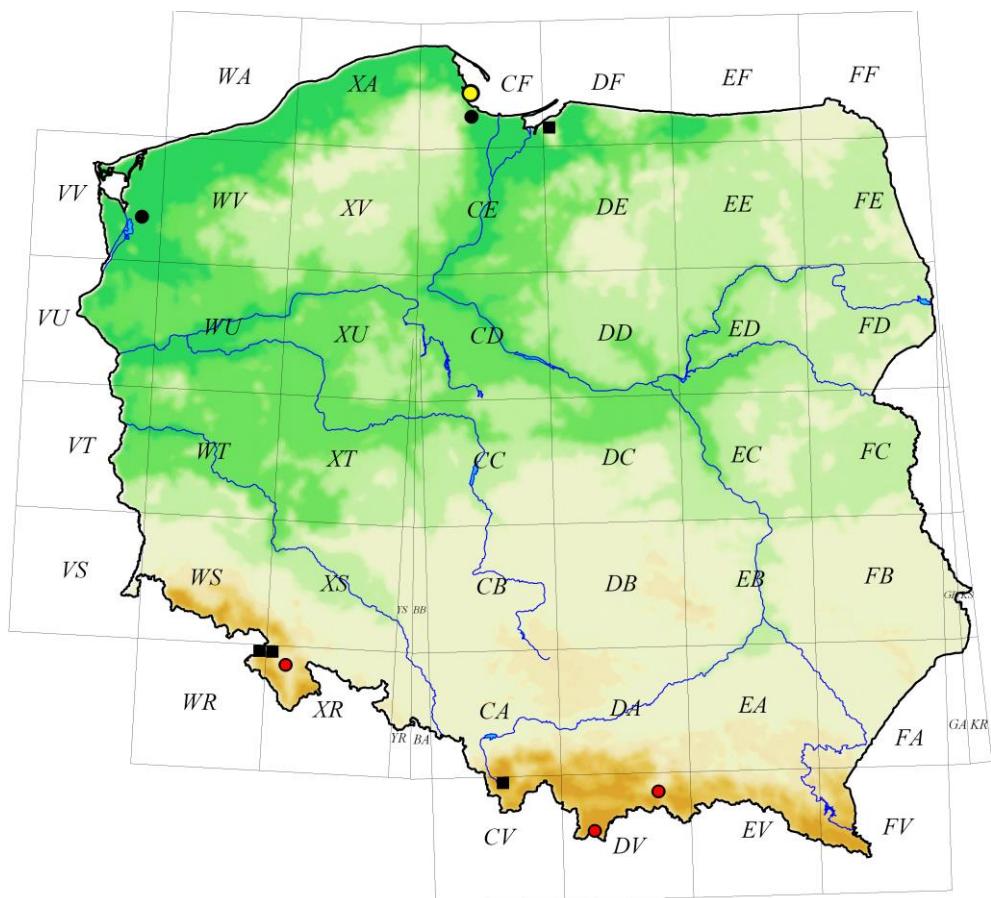

Fig. 2. *Calitys scabra* (published records – black squares, old records reported in the present paper – red circles), *Temnoscheila caerulea* (published records – black circles) and *Lophocateres pusillus* (yellow circle) – distribution in Poland.

Fig. 3. *Calitys scabra* – a historical specimen collected near Kłodzko (= Glatz) by K. LETZNER, deposited in the Senckenberg Deutsches Entomologische Institut, Müncheberg; phot. R. RUTA.

Biology. Develops in old, rotting coniferous trees, like spruce, pine, larch and fir; larvae feed on fungi; adults are usually collected under bark and in rotting wood (KOLIBÁČ et al. 2005).

Nemozoma caucasicum MÉNÉTRIÉS, 1832

Material examined. **Wielkopolska-Kujawy Lowland:** Plewiska ad Poznań (XU20), 23 IX–30 X 2017 – 30 exx., 15 IV–10 V 2018 – 12 exx., on a stack of firewood (mostly ash branches, 15–30 cm in diameter), leg. SK. **Małopolska Upland:** SAC “Dolina Zwolenki”, “Borowiec” res. (EB58), 1 V–25 V 2018 – 1 ex., IBL-2 window trap with a set of pheromones, edge of pine forest, leg. MM. **Upper Silesia:** Piekary Śląskie, Kozłowa Góra (CA58), 30 IX 2017 – 10 exx., in galleries of *Hylesinus varius* (FABR.) on a small piece of a *Fraxinus excelsior* L. branch lying on the ground, with numerous pupae, leg. HS, 28 X 2017 – 5 exx., under the bark of a dead branch of *Fraxinus excelsior*, in galleries of *Hylesinus* sp., leg. RK [JG]; “Łęczok” res. (CA05), 20 VI–9 VII 2018 – 1 ex., leg. JM [HS] (IBL2 trap). **Sandomierz Lowland:** Rzeszów, Śródmieście, Jagiellońska Street (EA74), 26 III 2011 – 1 ex., basement in a tenement house, on firewood, leg. PK [TO], det. AM.

Distribution. Species described from the Caucasus; recorded in Crimea, Germany, Austria, Poland, Slovakia and France (KOLIBÁČ 2007, PANKOW 2010, BRUSTEL & ROGÉ 2011). Records from some European countries during the past dozen or so years may be interpreted as an ongoing expansion. However, the oldest French specimen was collected in 1927 (BRUSTEL & ROGÉ 2011). Recently recorded in the Mazovian Lowland (HILSZCZAŃSKI 2006) as new for the Polish fauna. Also recorded in the Małopolska Upland and the Kraków-Częstochowa Upland (MIŁKOWSKI & WOJAS 2008), Lublin Upland (PLEWA et al. 2014) and other localities in the Mazovian Lowland (TATAR-DYTKOWSKI 2018). The species is new for the Wielkopolska-Kujawy Lowland, Upper Silesia and the Sandomierz Lowland (Fig. 4).

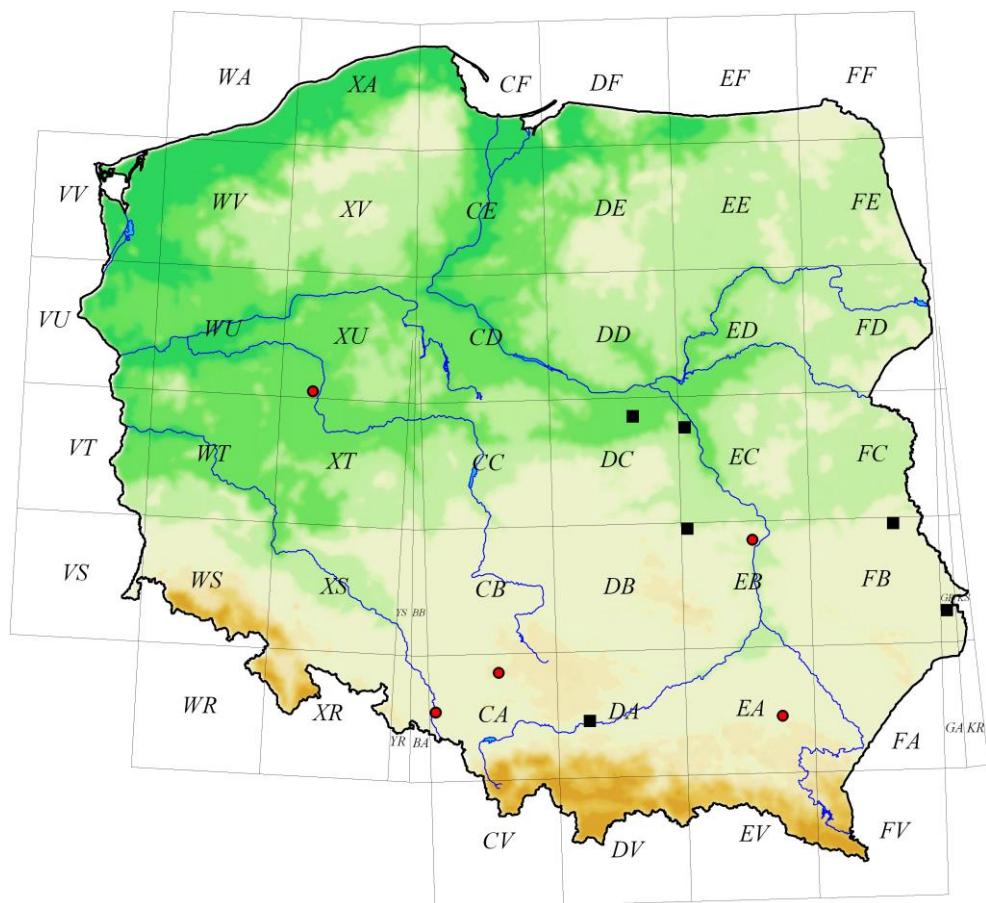

Fig. 4. *Nemozoma caucasicum* (published records – black squares, records reported in the present paper – red circles) – distribution in Poland.

Biology. According to observations from southern Russia, larvae develop in galleries of *Hylesinus fraxini* (PANZER, 1779) on ash, galleries of *Scolytus mali* (BECHSTEIN, 1805) on pear and in galleries of *Pteleobius vittatus* (FABRICIUS, 1792) on elm. The species has recently been recorded in central Poland on ash infested by *Hylesinus crenatus* (FABRICIUS, 1787) (Fig. 5). The beetles were found penetrating *H. crenatus* mother galleries in search of bark beetles (Fig. 6). A *N. caucasicum* imago was observed consuming a female of *H. crenatus* captured in its own gallery (TATUR-DYTKOWSKI 2018). Adult beetles emerge from the end of April or the beginning of May (KOLIBÁČ et al. 2005). According to recent observations, adults are active both in the bark and on its surface, where they actively search for bark beetles. Imagines prefer thick bark with cracks. They are active both in daylight and after dusk until midnight (TATUR-DYTKOWSKI 2018).

Fig. 5. Habitat of *Nemozoma caucasicum* – ash-alder carr (*Fraxino-Alnetum*), “Las Natoliński” nature reserve in Warsaw; phot. J. TATUR-DYTKOWSKI.

Fig. 6. Adults of *Nemozoma caucasicum* in larval galleries of *Hylesinus crenatus* (FABRICIUS, 1787) under the bark of *Fraxinus excelsior* L., “Las Natoliński” nature reserve in Warsaw; phot. J. TATAR-DYTKOWSKI.

Nemozoma elongatum (LINNAEUS, 1761)

Material examined. **Pomeranian Lake District:** Kujan vic. (XV41), near Karolewo forester’s lodge, 14 VIII 1999 – 2 exx., under the bark of a *Picea abies* (L.) H. KARST. branch, leg. RR. **Masurian Lake District:** Pisz Forest (“Puszcza Piska”), Snopki vic. ad Pisz, comp. 241 (EE44), pine forest, 28 V–17 VI 2013 – 1 ex., in an IBL-2bis barrier trap, leg. JMG; Pisz Forest, Snopki vic. ad Pisz, comp. 248 (EE44), pine forest, 9 VI–1 VII 2009 – 2 exx., in an IBL-2bis barrier trap, leg. JMG; Romincka Forest (“Puszcza Romincka”), Jurkiszki (EF81), 3 VII 2014 – 1 ex., leg. RP; Sosnowo vic., Sztabin (FE35), 24 V 2003 – 2 exx., on a stump of *Picea abies*, leg. MW. **Wielkopolska-Kujawy Lowland:** Puszczykowo vic. ad Poznań (WT97), pine forest, 6 V 1995 – 2 exx., under the bark of *Pinus sylvestris* L., in galleries of Scolytinae, leg. PJ. **Mazovian Lowland:** Borszyce ad Mszczonów (DC65), 7 IV 2005 – 2 exx., in a rotten limb of *Tilia* sp., leg. JTD; Ceglów ad

Błonie (DC67), 16 IV 2015 – 2 larvae, from branches of *Tilia cordata* MILL. lying on the ground, reared 4 VI 2015, leg. RP; Kozienice Forest ("Puszcza Kozienicka"), Augustów (EC30), 24 II 2001 – 1 ex., from a branch of *Picea abies* collected on 17 II 2001, leg. MM; Kozienice Forest, Dąbrowa Kozłowska (EC20), 6 V 2000 – 1 ex., from a branch of *Quercus* sp. collected on the ground, leg. MM; Kozienice Forest, Januszno (EC30), 26 XII 2002 – 1 ex., from a branch of *Tilia cordata*, leg. MM, 17 I 2003 – 2 exx., from a branch of *T. cordata*, leg. MM; Kozienice Forest, Przejazd vic. (EC30), 3 IV 2004 – 1 ex., under the bark of *Abies alba* MILL., leg. MM; Kozienice Forest, Stara Brzóza (EC21), 2 IV 2006 – 3 exx., *Tilia cordata*, reared 1–15 XII 2006, leg. RP; Kozienice Forest, "Załamanek" res. (EC20), 8 III 2007 – 1 ex., from a branch of *Abies alba* collected on 18 II 2007, leg. et cult. MM; Żabieniec ad Piaseczno (near a forest nursery) (EC06), 2 X 2013 – 4 exx., *Tilia cordata*, reared until 1 IV 2014, leg. RP. **Podlasie:** Olmonty ad Białystok (FD48), 21 IV 2000 – 1 ex., in flight in mixed broadleaved forest, leg. AL. **Białowieża Primeval Forest:** Białowieża NP, comp. 253D (FD84), Narewka river valley, 18–24 VI 1997 – 1 ex., 16–22 VI 1999 – 1 ex., in IBL-2bis barrier traps, leg. JMG; Białowieża NP, comp. 282B (FD85), Narewka river valley, 27 V–2 VI 1998 – 1 ex., 19–25 V 1999 – 1 ex., 3–9 V 2000 – 1 ex., in IBL-2bis barrier traps, leg. JMG; Białowieża NP, comp. 288C/318A (FD94), mixed broadleaved forest, 4 VII 1989 – 1 ex., in a turpentine baited IBL-2bis barrier trap, 2 VII 1993 – 1 ex., 1 VI 2006 – 1 ex., 24 V 2007 – 1 ex., in an unbaited barrier trap, 27 V 2006 – 1 ex., in a Moericke yellow pan trap installed at a height of 1 m, leg. JMG; Białowieża NP, comp. 368E (FD94), Narewka river valley, 2–8 VI 1999 – 3 exx., 17–23 V 2000 – 1 ex., in IBL-2bis barrier traps, leg. JMG; Białowieża NP/for. distr. Białowieża, Droga Browska, comp. 374D/403B (FD94), 11–25 VII 1996 – 1 ex., 13–19 V 1997 – 1 ex., 27 V–2 VI 1998 – 1 ex., 10–16 VI 1998 – 2 exx., 8–14 VII 1998 – 1 ex., in unbaited IBL2-bis barrier traps, leg. JMG; Białowieża NP/for. distr. Białowieża, Droga Browska, comp. 375B/375D (FD94), 7–13 V 1997 – 1 ex., 14–19 V 1997 – 1 ex., 20–27 V 1997 – 2 exx., 2–8 VII 1997 – 1 ex., 30 V–6 VI 1999 – 1 ex., 17–23 V 2000 – 1 ex., in IBL-2bis barrier traps, leg. JMG; for. distr. Białowieża, ad Teremiski, Dębina settlement vic., comp. 338A (FD84), oak-hornbeam forest, 22 V–9 VI 2014 – 1 ex., in a funnel trap installed in the tree crown, leg. JMG; for. distr. Białowieża, ad Teremiski, comp. 424C (FD84), *Tilio-Carpinetum* oak-hornbeam forest, 25 V 2015 – 2 exx., in an IBL-2bis barrier trap, leg. JMG; for. distr. Hajnówka, "Głęboki Kąt" res., comp. 439A (FD74), 16 V 1989 – 4 dead exx., reared from a broken spruce *Picea abies* 20 cm in diameter, collected on 31 VII 1986, also inhabited by *Ips typographus* (L.), *Polygraphus poligraphus* (L.) and *Acanthocinus griseus* (FABR.), leg. et cult. JMG; Olchówka, comp. 42 (FD85), 20 II 2016 – 1 ex., reared from a branch of *Picea abies*, leg. JŁ [AL]; Witowo, railway station (FD63), 13 V 1993 – 1 ex., leg. MW. **Lower Silesia:** Słup (XS17) [Schlaupe Kr. N.] – 1 ex., leg. GP [MNHW]; Sobótka (XS24), 29 V 1949 – 1 ex., ex coll. AEBG [MNHW]; Świebodzice (WS93), 16 IX 1962 – 1 larva,

leg. BB [MIZ]; Wrocław (XS46) [Breslau], ex coll. GP [MNHW]; Wrocław-Wilkszyn, Las Mokrzański (XS37), 25 VI 2006 – 1 ex., leg. MW. **Trzebnica Hills:** Trzebnica (XS49), 30 IV 1976 – 1 ex., leg. JŁ [USMB]. **Upper Silesia:** Blachówka (CA48), VI 2016 – 2 exx., ex cult from bark of *Picea abies*, leg. (FV15), 14 VIII 2013 – a dozen or so specimens under the bark of spruces *Picea abies* infested by bark beetles, leg. AM; Otryt Mt., eastern part (FV25), 16 VIII 2013 – 4 exx., on a stack of *Picea abies* wood, leg. AM.

Distribution. Occurs in north Africa, Europe and the Middle East. Known from the whole of Poland, although it is not a common species. It has recently been recorded in the Białowieża Forest, the Biebrza NP and the Bory Tucholskie forest (GUTOWSKI et al. 2006), fir forests in southern Poland (STARZYK et al. 2008) and north-eastern Poland (HILSZCZAŃSKI et al. 2016). New records from the western Sudeten Mts., eastern Sudeten Mts., Nowy Targ Basin, the Pieniny and Bieszczady Mts. (Fig. 7).

Biology. Larvae and adults feed on the eggs of bark beetles, larvae of wood-boring beetles and other insects. Beetles can be found under the bark of broadleaved and coniferous trees (KOLIBÁČ et al. 2005, this study) throughout the year. They were also observed on vegetation and in flight from the end of April until the end of July. According to the data in Table 1, spruce *Picea abies* is the preferred tree species overall (54% of records), and lime *Tilia cordata* is the preferred deciduous tree species (25% of records). It is plausible that *Nemozoma elongatum* is predatory on the scolytine *Ernoporus tiliae* (PANZER, 1793) (MM, unpublished).

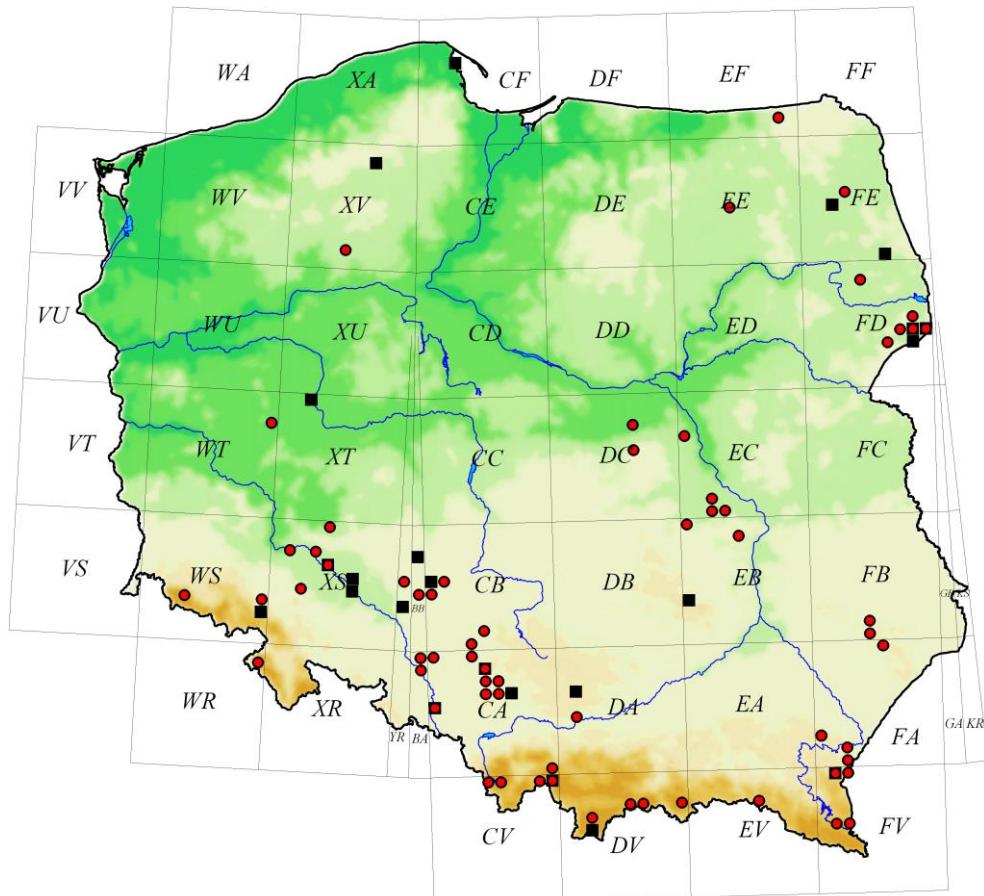

Fig. 7. *Nemozoma elongatum* (published records – black squares, records reported in the present paper – red circles) – distribution in Poland.

Temnoscheila caerulea (OLIVIER, 1790)

Material examined. Specimens from Poland are missing from the collections examined.

Distribution. The species is widely distributed in the Mediterranean region, ranging northwards as far as Germany (Bavaria), Poland and Sweden. In Sweden it is known from Gotska Sandön Island (LUNDBERG 1981). There are only two historical records from N Poland (Fig. 2): from the Gdańsk area over 200 years ago (KUGELANN 1794) and from Goleniów (KLEINE 1940).

Table 1. Occurrence of particular beetle species on trees; based on original data. Abbreviations: *Nc* – *Nemozoma caucasicum*, *Ne* – *N. elongatum*, *Tm* – *Tenebroides mauritanicus*, *Go* – *Grynocharis oblonga*, *Pf* – *Peltis ferruginea*, *Pg* – *P. grossa*, *Tl* – *Thymalus limbatus*, *N_s* – total number of species.

Biology. Feeds on larvae of Cerambycidae and Buprestidae; usually collected under the bark of dying coniferous trees (JANSSON 1925, BURAKOWSKI et al. 1986). In the Mediterranean region (Greece), found together with larvae of *Morimus funereus* MULSANT, 1863 on fir (JTD, unpublished).

Tenebroides mauritanicus (LINNAEUS, 1758)

Distribution. This species occurs in Europe and north Africa in nature, and is cosmopolitan under synanthropic conditions, e.g. in grain stores. There are some doubts regarding its taxonomic status. According to KOLIBÁČ 2013, it occurs in two forms: a synanthropic one and a free-living (forest) one, known in older papers as *Tenebroides fuscus* (GOEZE, 1777). BURAKOWSKI et al. (1986) described the forest form as very rare, even a relict of primeval forests. One can infer from the data gathered in the present paper that the forest form is common in the Polish lowlands, where it prefers forests in river valleys and avoids submontane and montane areas. The species has recently been recorded in Wrocław (BOROWIEC 2007) co-occurring with *Camponotus truncatus* (SPINOLA, 1808) ants; also recorded in Upper Silesia by GRZYWOCZ & SZOLTYS (1996) and MELKE & GRZYWOCZ (2003). New records from the Trzebnica Hills, Lublin Upland, Roztocze, Sandomierz Lowland and Bieszczady Mts. (Fig. 8).

Biology. The species occurs right across the country with the exception of submontane and montane areas. The forest form is recorded in areas where old, dying or dead trees are present. It is observed in riverine forests, roadside avenues and parks. The beetles occur under the bark of numerous deciduous trees, especially oaks (BURAKOWSKI et al. 1986),

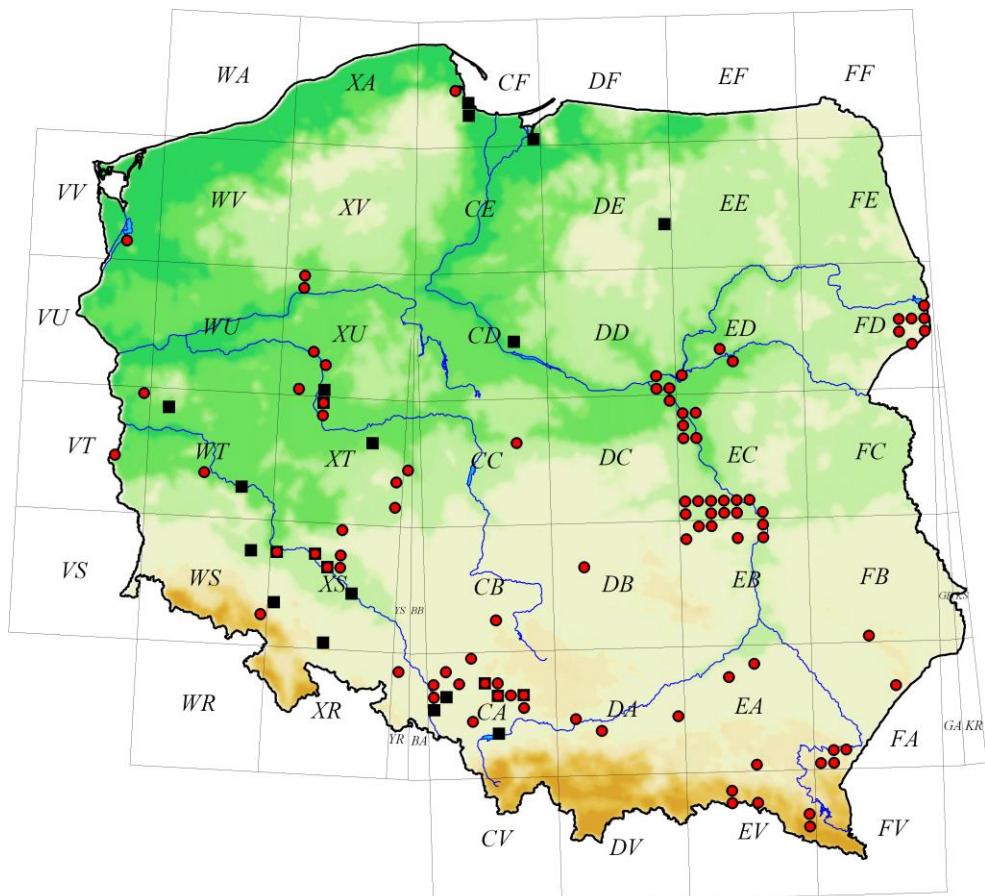

Fig. 8. *Tenebroides mauritanicus* (published records – black squares, records reported in the present paper – red circles) – distribution in Poland.

and occasionally coniferous ones, e.g. firs. This is confirmed by the data in the present paper – the species prefers oaks (36% of records) and various species of poplars (29% of records). Even dead and barkless trees are inhabited. Adults overwinter under bark, in its crevices, or in abandoned galleries of other insects. The beetles are encountered throughout the year, although they are also seen away from the host trees from the end of April until the beginning of August; adults are also attracted to artificial light sources.

Pupation was observed in July. Beetles of the forest form are predators on trees (KOLIBÁČ et al. 2005), whereas beetles of the synanthropic form are pests of stored products and are only occasionally predatory.

Family: Lophocateridae

Grynocharis oblonga (LINNAEUS, 1758)

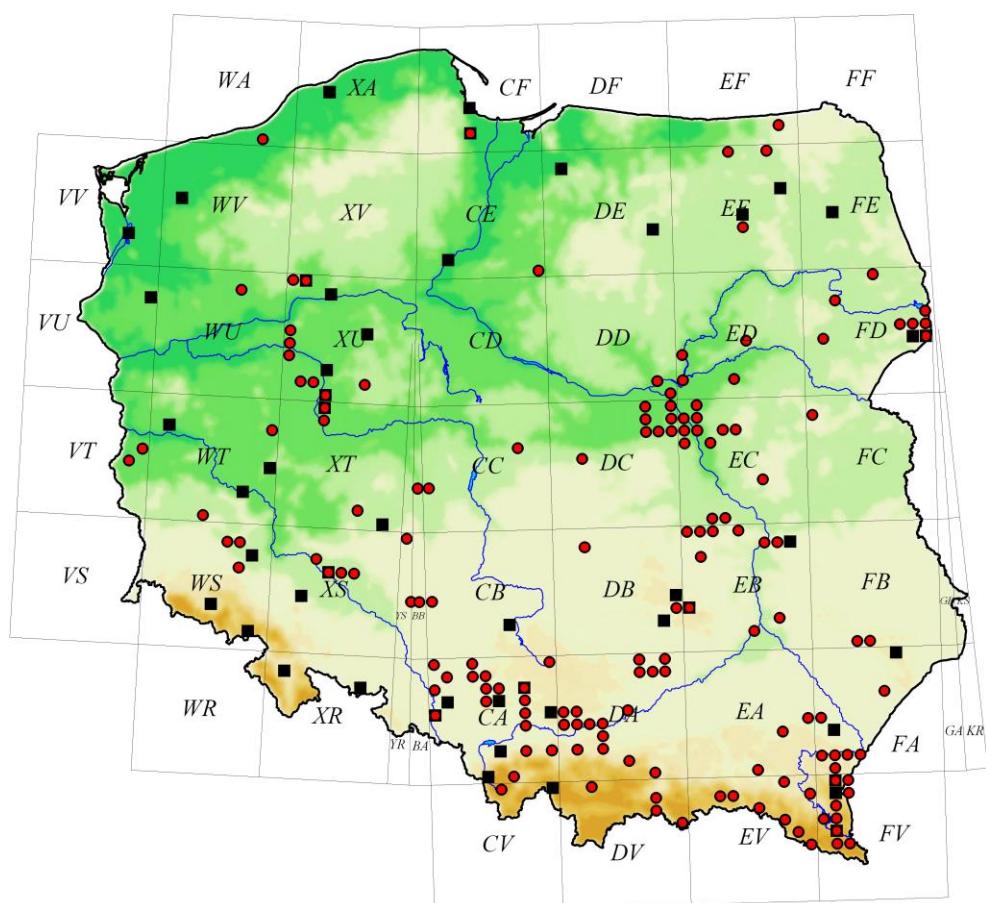

Fig. 9. *Grynocharis oblonga* (published records – black squares, records reported in the present paper – red circles) – distribution in Poland.

Distribution. Widely distributed in Europe. Common, with records from all over Poland. Recently recorded in the “Bieszczady” Natura 2000 site (OLBRYCHT et al. 2015), Gryżyński LP (RUTA et al. 2016) and Zdrojowy Park in Nałęczów (MIŁKOWSKI 2017). Newly recorded in Podlasie (Fig. 9).

Biology. Larvae and adults are fungivorous and develop in the rotting wood of trees with soft wood, mostly broadleaved (willow, poplar, occasionally oak, beech, alder and hornbeam) and coniferous (fir) trees (BURAKOWSKI et al. 1986, KOLIBÁČ et al. 2005, this study). According to the list in Table 1, this is the most ubiquitous species of the families under discussion here in the Polish fauna. It has been recorded on 20 genera of trees, preferring oaks (23% of records), willows (18%) and poplars (17%). Adults are collected both under the bark and on polypores throughout the year; they are active from mid-April until mid-July, and pupate in August.

Lophocateres pusillus (KLUG, 1833)

Material examined. **Baltic Coast:** Gdynia (CF44), 11 VII 1934 – 2 exx. leg. AB [ISEA].

Distribution. A cosmopolitan beetle, native to tropical and subtropical areas, introduced in other regions of the world. A few cases of introduction to Gdynia (Fig. 2) in the 1960s were noted by BURAKOWSKI et al. (1986). A specimen collected as long ago as 1934 indicates that it had been introduced much earlier, in the first years of operation of the port in Gdynia.

Biology. Larvae and adults inhabit stored products, like rice, maize and other grains.

Family: Peltidae

Peltis ferruginea (LINNAEUS, 1758)

Material examined. **Pomeranian Lake District:** Szczecin [Stettin] (VV71) – 1 ex., ex coll. Distribution. A widely distributed, Holarctic species. Known from the whole of Poland, though rarely encountered. Most records are from the south and east of the country. More common in well-preserved forests rich in deadwood overgrown with fungi. Recently recorded by OLBRYCHT et al. (2015) in the “Bieszczady” Natura 2000 site co-occurring with *Rhysodes sulcatus* (FABRICIUS, 1787) and in the Roztocze region (PAPIS, MOKRZYCKI 2015). New for the Małopolska Upland and the Nowy Targ Basin (Fig. 10).

Biology. Larvae develop in the rotting wood of various trees, and occasionally in building timber (BURAKOWSKI et al. 1986, KOLIBÁČ et al. 2005). The data summarised in the present paper show that it prefers coniferous trees, like spruce (39% of records) and fir (35%). Adults can be seen throughout the year in places where beetles feed and conceal

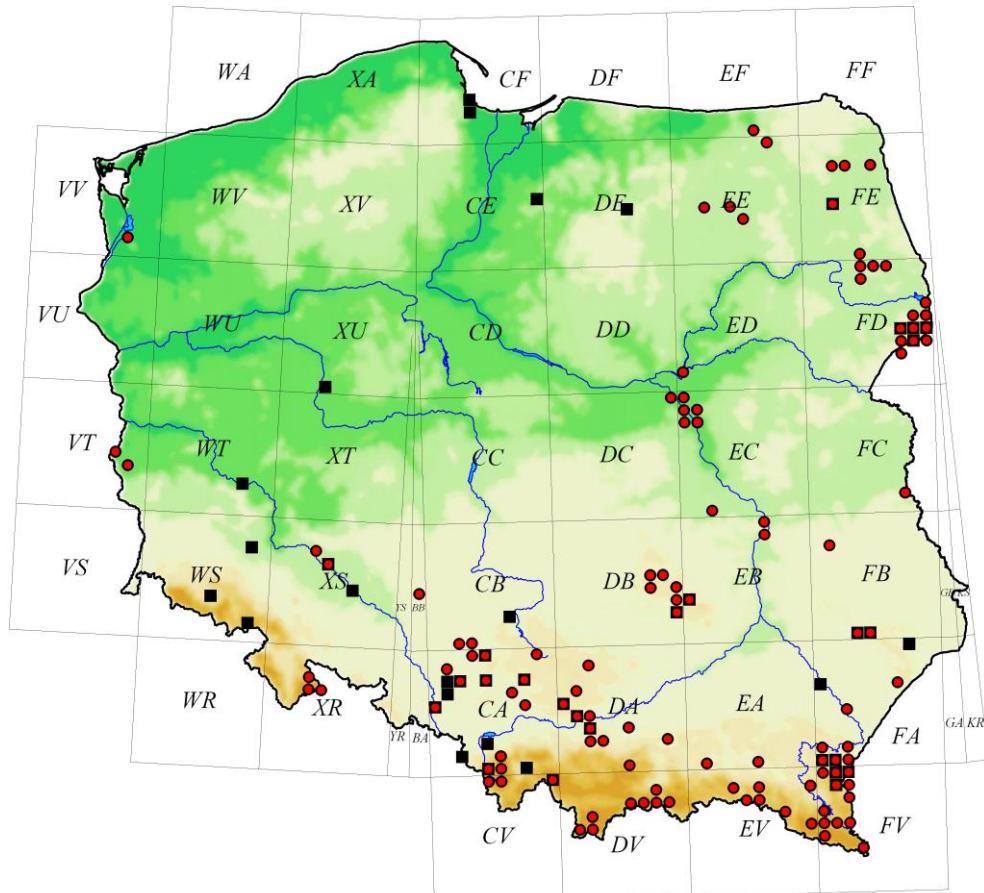

Fig. 10. *Peltis ferruginea* (published records – black squares, records reported in the present paper – red circles) – distribution in Poland.

themselves – under bark, in decaying wood, in the crevices of trunks, hollows, etc. The beetles can be observed from April until mid-October, with their activity peaking between late April and late July.

Peltis grossa (LINNAEUS, 1758)

Distribution. Species inhabiting the whole of Europe, rarely observed in Poland. Known mainly from the east of the country and the Świętokrzyskie Mts. A relict of primeval forests. Recently recorded from the Świętokrzyskie Mts. and Suchedniów Plateau (Płaskowyż Suchedniowski) (BUCHHOLZ, BIDAS 2012), Białowieża Forest (PLEWA et al. 2015), Roztocze (PAPIS, MOKRZYCKI 2015) and Bieszczady Mts. (HOLLY 2016). Nowadays it occurs only in eastern Poland. Historical records from the Sudeten Mts. in western Poland have not been confirmed for many years. Newly recorded in the Mazovian Lowland and Małopolska Upland (Fig. 11).

Biology. Develops in soft, rotten wood overgrown with fungi. According to BOROWSKI (2006) it is monophagous on *Fomitopsis pinicola*. Associated with firs and spruces in montane forests but also with other species of trees, e.g. birches (Fig. 12) (BURAKOWSKI et al. 1986, KOLIBÁČ et al. 2005, this study). According to the present data (Tab. 1), it shows a strong preference for firs (63% of records). Adults can be observed throughout the year in feeding galleries and places of concealment – under bark and in deadwood of both snags and fallen trees, also in windthrows, tree stumps, and thick branches; the beetles are active from the end of April until mid-July, mainly in May and June.

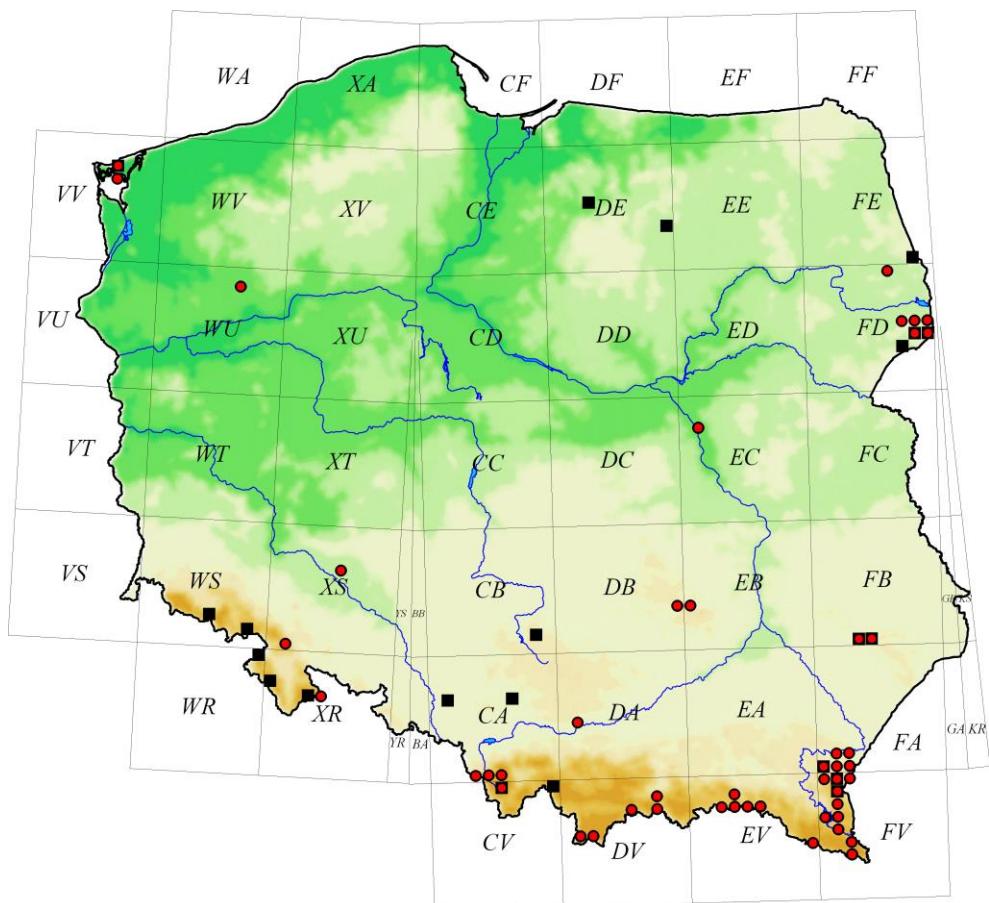

Fig. 13. *Thymalus limbatus* (published records – black squares, records reported in the present paper – red circles) – distribution in Poland.

Distribution. Widely distributed in Europe, reaching northern Africa. Rarely collected in Poland – a relict of natural forests. Recorded in radiocarbon-dated subfossil remains from ca. 10000 BP (PAWŁOWSKI & KUŚKA 1987). Occurs in southern Poland, the Białowieża Forest and scattered localities in the lowlands. Recently recorded in the Białowieża Forest and Podlasie (PLEWA et al. 2014). New records from the Pomeranian Lake District, Mazovian Lowland, Trzebnica Hills and Tatra Mts. (Fig. 13).

Biology. A fungivorous species associated with trees of numerous species, mostly broadleaved (beech, birch, lime) but also coniferous (spruce) (BURAKOWSKI et al. 1986, KOLIBÁČ et al. 2005, this study). Both adults and larvae feed on wood overgrown with fungi. Sometimes, the beetles are attracted in great numbers to the sporocarps (see above the record by HS from Wolibórz). Adults can be observed throughout the year in feeding galleries or in places of concealment; the beetles are active from mid-May until the beginning of August. According to the present data (Tab. 1), it prefers fir (28% of records) and beech (23%).

DISCUSSION

Species of Trogossitidae, Lophocateridae, Peltidae and Thymalidae are associated with forests and have various habitat preferences. Several species, like *Calitys scabra*, *Grynocharis oblonga*, *Peltis ferruginea*, *P. grossa* and *Thymalus limbatus* are mycophagous, while others, like *Nemozoma caucasicum*, *N. elongatum*, *Temnoscheila caerulea* and *Tenebroides mauritanicus* are predators. Two species, *Lophocateres pusillus* and occasionally also *T. mauritanicus*, have been recorded as pests of stored products.

The amount of data collected in the present paper allowed us to analyse the habitat preferences of these beetles. Data on preferred trees were analysed for 290 records and 7 species (Tab. 1). The most ubiquitous species was *G. oblonga*, which was found on 22 genera of trees. *Nemozoma caucasicum* is strictly associated with ash (*Fraxinus excelsior*) in Poland, although the number of available records was small. Both species of *Peltis* preferred coniferous trees – spruces and firs. In contrast, *Tenebroides mauritanicus* and *Grynocharis oblonga* were associated with deciduous trees. Two species – *Nemozoma elongatum* and *Thymalus limbatus* – occurred on deciduous and coniferous trees with similar frequencies. The most attractive trees for these beetles were fir (6 species), spruce and oak (each with 5 species), and beech (4 species). *Grynocharis oblonga* occurred on adventive species, like *Aesculus hippocastanum*, *Philadelphus* sp., *Juglans regia*, *Platanus orientalis*, *Robinia pseudoacacia*, and on fruit trees. In most cases, it was the only representative of the beetle families examined here on these tree taxa.

Table 2. Observations of beetles in natural forests, managed forests, and anthropogenic localities; based on original data (total number of localities analysed: 133). Abbreviations: NP – number of localities in natural and protected forests, NM – number of localities in managed forests, A – number of anthropogenic localities (avenues, parks), Σ – sum.

Species	NP	NM	A	Σ
<i>Nemozoma elongatum</i>	8	3	1	12
<i>Tenebroides mauritanicus</i> *	7	2	13	22
<i>Grynocharis oblonga</i>	17	6	15	38
<i>Peltis ferruginea</i>	30	5	0	35
<i>Peltis grossa</i>	13	3	0	16
<i>Thymalus limbatus</i>	12	1	0	13
$\Sigma =$	86	18	29	133

* records from synanthropic localities have been omitted

Table 3. Species included in red lists in Central Europe. Abbreviations: PL – Poland (PAWŁOWSKI et al. 2002/ROSSA 2004); Ge – Germany (GEISER 1998); IUCN – IUCN red list, P/V – restricted to primeval/virgin forests; CR – critically endangered; EX? – probably extinct, 1 – vom Aussterben bedroht (= CR); 2 – stark gefährdet (= EN); 3 – gefährdet (= VU, vulnerable), LC – least concern, DD – data deficient.

Species	PL	Ge	IUCN	P/V
<i>Calitrys scabra</i>	CR/EX?	1	–	–
<i>Grynocharis oblonga</i>	–	2	LC	ECKELT et al. (2018)
<i>Peltis ferruginea</i>	–	2	LC	KOLIBÁČ et al. (2005)
<i>Peltis grossa</i>	VU/-	1	–	KOLIBÁČ et al. (2005)
<i>Temnoscheila caerulea</i>	EX?/-	–	–	–
<i>Tenebroides mauritanicus</i>	–	2	DD	BURAKOWSKI et al. (1986)
<i>Thymalus limbatus</i>	–	3	LC	KOLIBÁČ et al. (2005)

Data on habitat preferences were analysed for 133 localities and 6 species (Tab. 2). Synanthropic habitats, like stores and flats, were not included in the analysis. There were only a small number of records from managed forests, quite possibly because of the greater interest among entomologists in the exploration of natural forests and protected areas. Despite this bias, we think that the results of this analysis are worth publishing. Forest habitats were divided into three categories: natural forests, managed forests and anthropogenic tree stands like avenues and parks. *Grynocharis oblonga* and *Tenebroides mauritanicus* were observed in anthropogenic tree stands and in managed forests more often than other species. *Nemozoma elongatum* was most frequently recorded in natural

forests, and only exceptionally in anthropogenic sites. The other three species – *Peltis ferruginea*, *P. grossa* and *Thymalus limbatus* – were never collected in avenues or parks, and only rarely collected in managed forests; they were usually recorded in natural forests, often with large volumes of deadwood. Our results confirm the data published by KOLIBÁČ et al. (2005) (Tab. 3), but do not justify treating either *G. oblonga* or *Tenebroides mauritanicus* as relicts of primeval forests (BURAKOWSKI et al. 1986, ECKELT et al. 2018).

The occurrence of two of the species in question here – *Calitys scabra* and *Temnoscheila caerulea* – has not been confirmed in Poland for over 100 years. *Grynocharis oblonga*, *Nemozoma elongatum* and *Tenebroides mauritanicus* are relatively common. *Peltis ferruginea*, *P. grossa* and *Thymalus limbatus* are more or less rare and larger numbers of individuals are observed only occasionally. *Nemozoma caucasicum* is a very interesting species, described in 1832 from the Caucasus, which has expanded its range in recent decades, although it was recorded in France as early as in 1927.

Several species from these four families are included in red lists of endangered species in Europe (GEISER 1998, PAWŁOWSKI et al. 2002, NIETO & ALEXANDER 2010). The categories of threat on the Polish Red List (PAWŁOWSKI et al. 2002) appear to be correctly assigned to these species, but we think that *Peltis ferruginea* and *Thymalus limbatus* should be added to the list. The IUCN and German red lists (GEISER 1998) include two species that are common in Poland, namely, *Grynocharis oblonga* and *Tenebroides fuscus*; this is probably justified in view of the deteriorating conditions of habitats in western Europe. Stenotopic species, like *Calitys scabra*, *Peltis ferruginea*, *P. grossa*, *Temnoscheila caerulea* and *Thymalus limbatus*, can be used as indicator species of natural forests. While *Calitys scabra* and *Temnoscheila caerulea* are probably extinct in Poland, other species, like *Peltis ferruginea*, *P. grossa* and *Thymalus limbatus*, are quite often observed in natural forests. All these species are relatively abundant in the Białowieża Forest, Świętokrzyskie Mts., Roztocze and Carpathians Mts. Numerous localities are protected in national parks and nature reserves, but as a consequence of the intensification of forest management, we feel it is reasonable to establish other areas protecting their populations. One such area is the proposed Turnica National Park, which should protect one of the best-preserved mountain forests in Poland (DEMBEK et al. 2014) and one of the most important areas for endangered invertebrates (including Coleoptera) in central Europe (BUCHHOLZ & MELKE 2018).

The genus *Thymalus* LATREILLE, 1802 requires a systematic revision of specimens collected throughout its range. The occurrence of *Thymalus oblongus* REITTER, 1889 in Poland seems plausible, as the species has already been recorded in Scandinavia and the European part of Russia (KOLIBÁČ 2007). In the authors' opinion, however, the existing literature does not permit certain identification of this species.

Ancyrona japonica REITTER, 1889, originally an Asian species, was introduced to several European countries. It became acclimatised in Slovakia, Hungary, Czechia and

probably also in Bulgaria, as it has been regularly collected there since 1904 (KOLIBÁČ 2013). It is likely that the species is already present in Poland, as the known localities are situated in neighbouring countries. The larval characters of *Ancyrona* are described in KOLIBÁČ (2006), and KOLIBÁČ & ZAITSEV (2010), but especially in the case of the early instars, identification may be doubtful or even impossible when using the existing keys (KLAUSNITZER 1996). The morphology of immatures of *Ancyrona* REITTER, 1876 and *Grynocharis* C.G. THOMSON, 1859 requires further study.

ACKNOWLEDGEMENTS

The data from the Przemyśl Foothills obtained in 2011–2016 come from the inventory of saproxylic beetles carried out for the purposes of establishing the Turnica National Park (the National Park of the Carpathian Foothills) and the planned “Carpathian Forest” (“Puszcza Karpacka”) nature reserve. The project was implemented with financial support from the “Natural Heritage” Foundation and the WWF Poland Foundation.

The data from the Bieszczady Mountains come from the inventory of saproxylic species including indicators of natural forests within the Lutowiska and Stuposiany Forest District (2013–2014) and from the Cisna and Komańcza Forest District (2015) in the Natura 2000 area PLC180001 Bieszczady. The project was financed by the Natural Heritage Foundation (Fundacja Dziedzictwo Przyrodnicze) and the WWF Poland Foundation.

The information from the Magura NP (2014) comes from an inventory of beetles carried out as a part of the work on the Protection of the Magura NP Fauna and the Protection Plan for the “Ostoja Magurska” Natura 2000 site. The project was carried out for the Institute of Nature Conservation, Kraków, and the Natural Heritage Foundation.

The materials from the environs of Paćlaw were collected by Tomasz OLBRYCHT in 2015–2016 within the framework of project No. DEC-2013/11/B/NZ9/00793, financed by the National Centre of Science.

The data from the Pieniny NP (2017) come from the project: “Beetles (Coleoptera) inhabiting fruiting bodies of fungi (Macromycetes) in the Pieniny National Park”, which was co-financed from the forest fund.

We would like to thank Edward BARANIAK, Adam BOHDAN, Lech BOROWIEC, Lech BUCHHOLZ, Tadeusz BZIUK, Piotr CHACHUŁA, Roland DOBOSZ, Paweł JAŁOSZYŃSKI, Tomasz KOŚCIELNY, Wojciech KUBASIK, Krzysztof LUBECKI, Jerzy ŁUGOWOJ, Tomasz MAJEWSKI, Tomasz NABIAŁKOWSKI, Radosław PLEWA, Stanisław SZAFRANIEC, Krzysztof SUĆKO and Katarzyna ŹUK for making their collections available for the present study.

We thank Tomasz HUFLEJT and Przemysław SZYMROSZCZYK for allowing Marek MIĘKOWSKI and Jan TATAR-DYTKOWSKI to study the collection of the Museum and

Institute of Zoology, Polish Academy of Sciences (Łomna-Las). Jan TATAR-DYTKOWSKI is also grateful to Maria KOŚCIESZA and Monika MALCHER from the Library of the Museum and Institute of Zoology, Polish Academy of Sciences (Warsaw), for their great support in the search for historical literature. We extend our gratitude to Stephan BLANK and Lutz BEHNE for their kind assistance during the visit of Rafał RUTA to the Senckenberg Deutsches Entomologische Institut, Müncheberg, in December 2018.

Finally, we thank Paweł JAŁOSZYŃSKI for sharing information on the larval morphology of Lophocateridae.
